Useful Searches About us

Elfima is an web solution for small businesses. We create and publish products, services and business solutions on the Internet for the Internet savvy small businesses. We are partners with like minded people, companies and other organizations that share our passion for helping small

businesses succeed online. Q: Do real numbers have unique decimal representations? "The decimal representation of any real number is unique." But every real number is a sequence of integers, so this means that the decimal representation of every real number contains all of the integers. How is this possible? Edit: I'd like a proof or a reference to a proof of this. I'm not looking for an answer to this particular question, I'm looking for something that can be used in other contexts. A: If you write any real number as a decimal number, i.e. a decimal with exactly as many digits as there are real numbers in the unit interval, the decimal number is unique. That follows easily from any proof of the fact that the number of rationals in the unit interval is countable. To see why it holds for real numbers, consider the integers from 0 to 1. A: If r is a real number, then a decimal expansion of r is a sequence a_n of

rational numbers such that

$\forall n \in \mathbb{N}, \exists m, n \in \mathbb{N} :$ $\text{if } n \leq$

$N, \wedge n \in \mathbb{N} : a_n$
 e_0 implies

$n = m, \wedge \forall k = 0, 1, 2, \dots :$
 $a_{k=0}$

$r = \sum_{n \in \mathbb{N}} a_n \cdot 10^{-n}$

System Requirements For Elfima Pastel:
